Applications

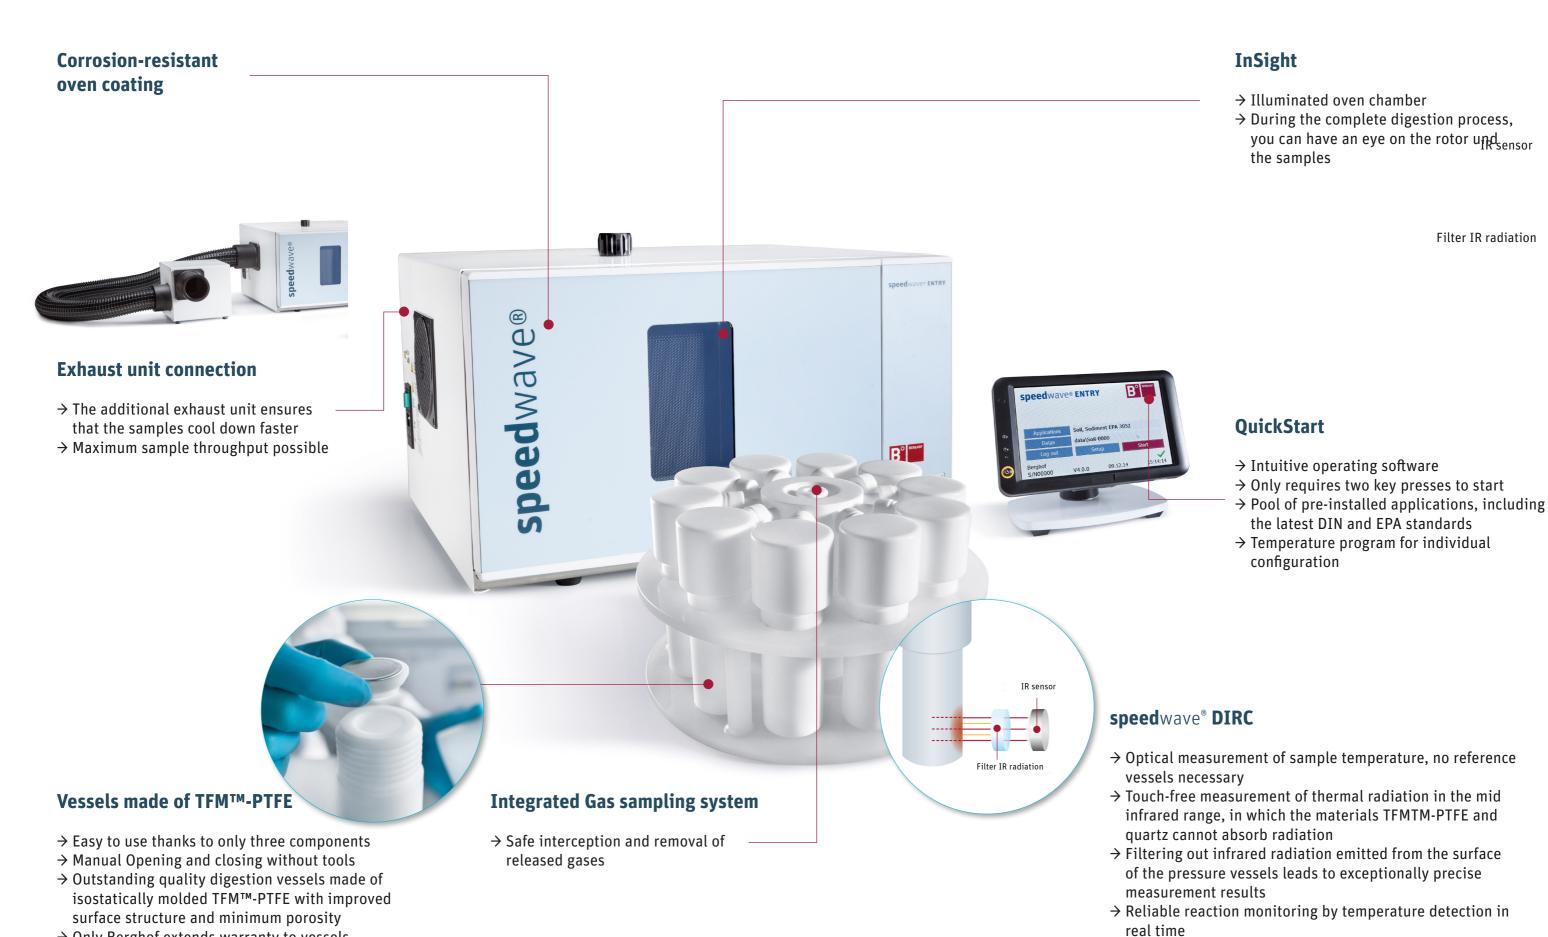

BERGHOF PRODUCTS + INSTRUMENTS LTD

Easy, safe and efficient

→ Only Berghof extends warranty to vessels

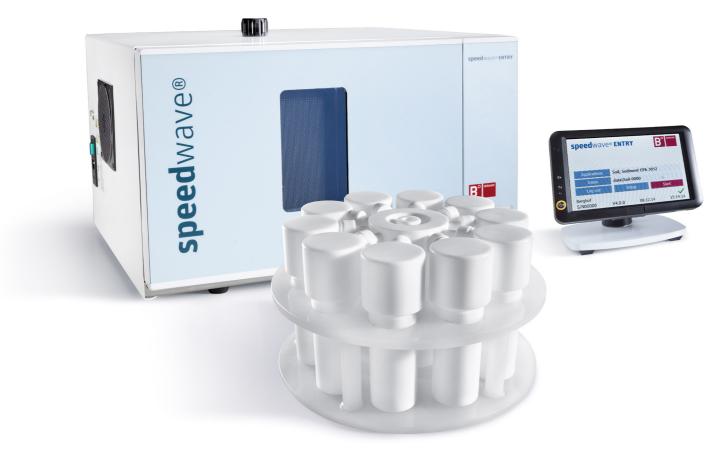

Perfect for routine analysis, study and training

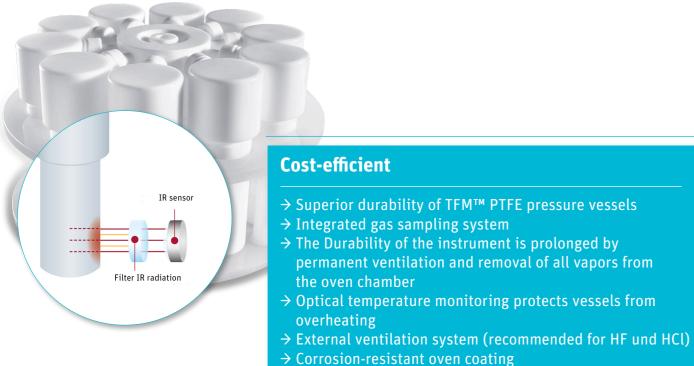

speedwave ENTRY

STRIPPED DOWN TO THE ESSENTIALS

The Speedwave Entry shows its strengths in application areas where cost efficiency is a key issue. Therefore, it is often used in routine analysis for standardized digestions in research institutions, for training and at universities.

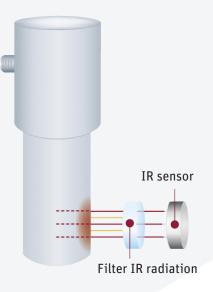

speedwave ENTRY vessels

PATENT-PROTECTED SENSOR TECHNOLOGY

The patented optical measuring method Speedwave Dirc provides for direct and non-contact real-time measurement of the sample temperature in the digestion vessel. We monitor the temperature inside the vessels by using infrared radiation. In contrast to other suppliers, we do not use a reference vessel to monitor the sample temperature. Instead, we permanently check all vessels in real time reading out the maximum sample temperature.

SURVEY OF VESSEL TYPES				
	DAP-60K	DAQ-10		
Volume	60 ml	10 ml		
Operating pressure	40 bar	75 bar		
Operating temperature	230° C	230° C		
Rotor	10 vessels	24 vessels		

Reproducible & efficient

- → No cross-contamination thanks to minimal porosity of the vessel surface
- → Real-time monitoring of all sample temperatures
- → Above average long durability of the vessels (more than 10,000 digestions)

Variable

- → Intelligent vessel concepts for a wide range of applications:
- → DAP-60K vessels are made entirely of TFM™-PTFE featuring high chemical resistance to all mineral acids and high mechanical strength
- → DAQ quartz glass inserts enable the digestion of small sample volumes

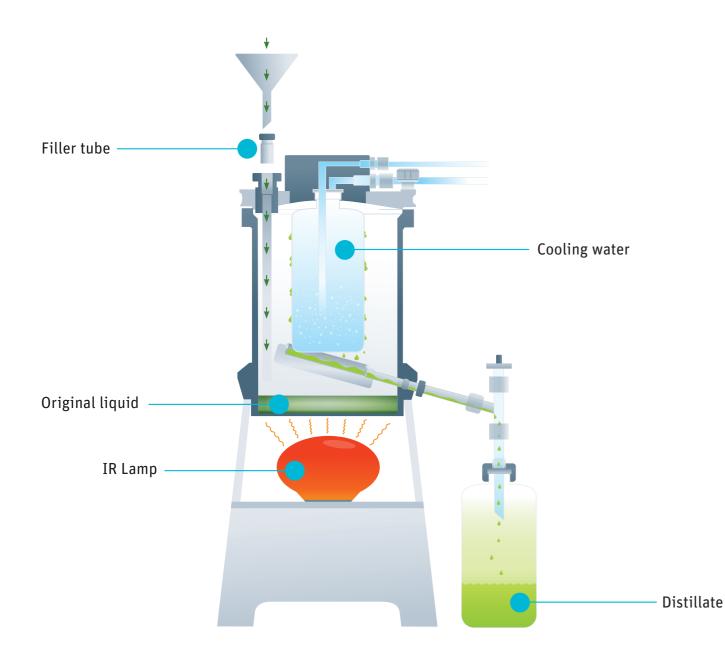

GETTING OUT OF THE COST TRAP

On the one hand, modern analytical laboratories have to perform high-quality analyses in the ultratrace range, but on the other hand they also have to minimize the costs for chemicals and consumables. The Berghof subboiling apparatus produces quality and pays for itself quickly. As a user, you benefit from absolutely pure acids at the lowest possible operating costs.

SUBBOILING-PRINCIPLE:

The subboiling apparatus is used to produce high-purity acids for ultratrace analysis. Via infrared heating, it distills the acid at temperatures of 10-20°C below the boiling point very carefully. This prevents the formation of droplets and aerosols and ensures a uniquely efficient purification.

- → Fields of application: HNO₃, HCL, HF und H₂O
- → Distillation volumes: Less is more lower distillation volumes mean higher purity of the acid yielded. In 24 h, approximately 1.2 L HNO₃, 1.1 L HCL, 1.0 L HF or 1.8 L H₂O are gained.

Distillacid

PURITY LEVELS

Unmatched purity

- → Starting from p.a. qualities, high-purity acids with contaminations in the sub-ppb range are obtained
- **→ Multiple-Subboiling** Leads to even purer acids at sup-ppt level
- **→ Cost-effective** The system pays for itself within one year
- → High durabilty The system consists solely of high-purity materials such as TFM™-PTFE, PTFE and PP
